

Image Classification: A Neural Network Approach to Cleanliness Detection.

In this project, I aim to differentiate between dirty and clean plates using machine learning. The dataset, sourced from a Kaggle competition.

I will utilize transfer learning to leverage pre-trained models, enhancing classification accuracy.

After training, I will implement an active learning approach, where I will select samples with the highest likelihood predictions from an unlabeled dataset. These selected samples will then be labeled and added to the training set, allowing me to iteratively improve the model.

Ultimately, I will submit the predictions on the Kaggle platform and apply the trained model to my own images of plates to assess its performance in real photos by uploading here.

Data set is provided form [Kaggle Clean/Dirty images](#)

Outline

- 1 - Import Data
- 2 - Images preprocess and augmentation
- 3 - Training models
- 4 - Make file for submition and get the score
- 5 - Testing with my own images

1 - Import Data

First, let's import required dependencies

In [2]:

```
from tensorflow.keras.preprocessing.image import ImageDataGenerator
from tensorflow.keras.preprocessing.image import load_img, img_to_array
from tensorflow.keras.callbacks import ModelCheckpoint
from tensorflow.keras import layers, models
from tensorflow.keras.preprocessing import image_dataset_from_directory
from IPython.display import display
from IPython.display import Image as image
import tensorflow as tf
import matplotlib.pyplot as plt
from tqdm import tqdm
import numpy as np
import os, glob, re
from PIL import Image
import pandas as pd
import random
```

```
import shutil
import cv2
from ipywidgets import widgets
from io import BytesIO
```

In [28]:

```
seed = 42
tf.random.set_seed(seed)
```

In [120...]:

```
class_names = ["cleaned", "dirty"]
train_path = "/Users/sergeiakhmadulin/Documents/No_background/train/"
val_path = "/Users/sergeiakhmadulin/Documents/No_background/valid/"
test_path = "/Users/sergeiakhmadulin/Documents/No_background/test/"
```

In [82]:

```
orig_img = re.compile(r'^\d{4}\.jpg$')
augm_image = re.compile(r'augmented_image_\d{4}\.jpg_\d+')
```

Let's investigate how many images do we have for train and test

In [151...]:

```
for class_name in class_names:
    full_path = train_path + class_name + "/"
    print(f"Files in train folder of class {class_name}: {len(list(filter(lambda x: x.endswith('.jpg'), os.listdir(full_path))))}")

Files in train folder of class cleaned: 20
Files in train folder of class dirty: 20
```

In [34]:

```
files = os.listdir(test_path)
files = list(filter(lambda x: x.endswith('.jpg'), files))
print(f"Files for labeling in test directory: {len(files)})")

Files for labeling in test directory: 744
```

We have very few original images for training but a large number of images to label. In this approach, I will use augmentation techniques to generate many additional images by transforming the originals.

In [103...]:

```
def show_some_images(path, class_name, augmented = False, name_table = "0")
    """
    Function that shows 4 images for given path and class name

    Parameters:
    path: location for folders of classes with images
    class_name: variable of given names of classes
    augmented: flag of augmentation
    name_table: table name that indicates whether images are original or a

    Outputs:
    Nothing, just shows images
    """
    full_path = train_path + class_name + "/"
    files = os.listdir(full_path)
    files = list(filter(lambda item: orig_img.match(item), files))
    if augmented:
        files = os.listdir(full_path)
        files = list(filter(lambda item: augm_image.match(item), files))
```

```
files = [os.path.join(full_path, filename) for filename in files]

fig, axes = plt.subplots(1, 4, figsize=(14, 5))
fig.suptitle(f'{name_table} images of class: {class_name}', fontsize=16)

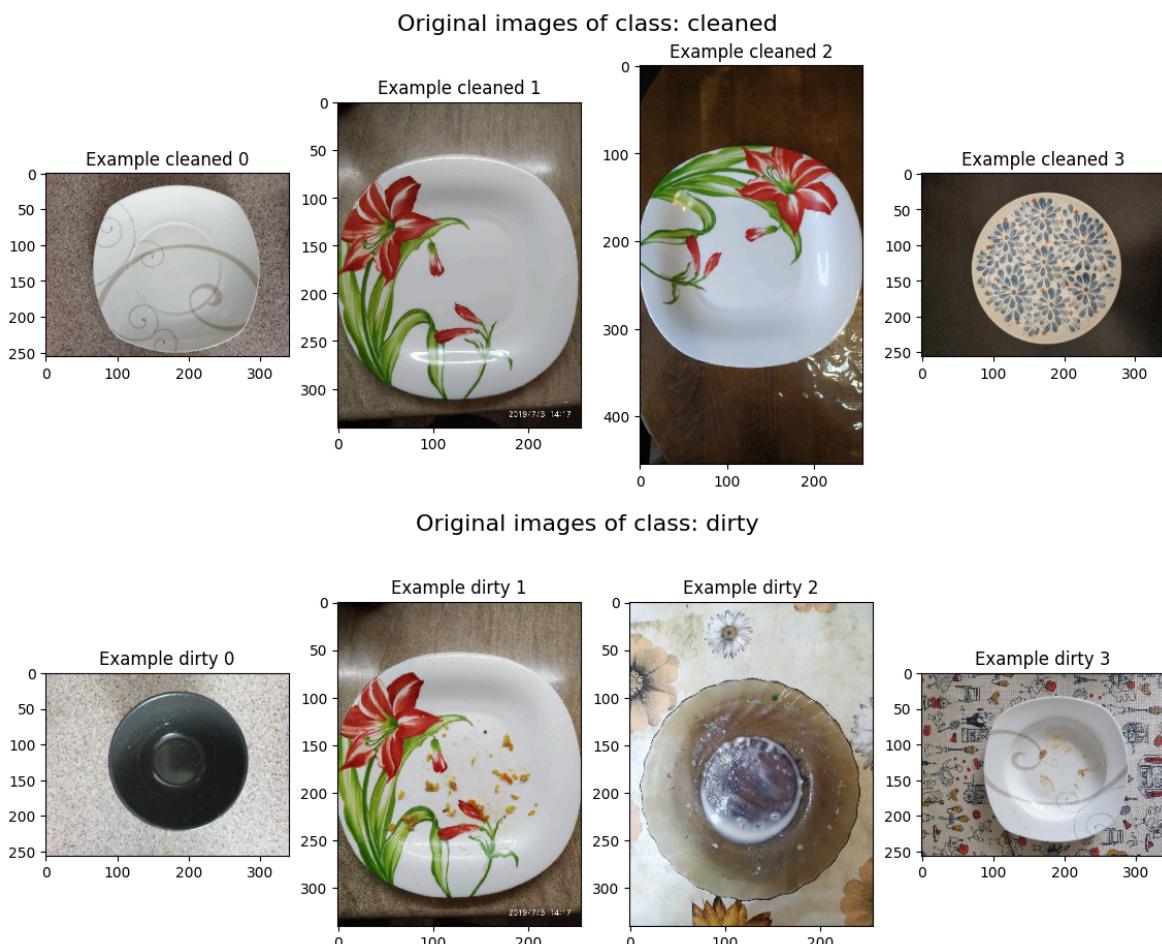

for i, image in enumerate(files[:4]):
    img = tf.keras.utils.load_img(image)
    axes[i].imshow(img)
    axes[i].set_title(f'Example {class_name} {i}')

plt.show()
```

Let's have a look at original images of both classes

In [121]:

```
for i in range(2):
    show_some_images(train_path, class_names[i])
```

2 - Images preprocess and augmentation

For better performance of model I will remove background from each image.

In [17]:

```
class MyRemoveBackground:
    """
    Remove images background.
    Class for removing background from images
    """
```

```

.....
def __init__(self):
    pass

def __call__(self, in_img):

    # Convert image to numpy array
    in_img = np.array(in_img)

    # Get the height and width from OpenCV image
    height, width = in_img.shape[:2]

    # Create a mask holder
    mask = np.zeros([height, width], np.uint8)

    # Grab Cut the object
    bgdModel = np.zeros((1, 65), np.float64)
    fgdModel = np.zeros((1, 65), np.float64)

    # Hard Coding the Rect The object must lie within this rect.
    rect = (15, 15, width-30, height-30)
    cv2.grabCut(in_img, mask, rect, bgdModel, fgdModel, 10, cv2.GC_IN
    mask = np.where((mask==2)|(mask==0), 0, 1).astype('uint8')
    out_img = in_img * mask[:, :, np.newaxis]

    # Get the background
    background = in_img - out_img

    # Change all pixels in the background that are not black to white
    background[np.where((background > [0, 0, 0]).all(axis = 2))] = [255, 255, 255]

    #Add the background and the image
    out_img = background + out_img

    return Image.fromarray(out_img)

```

```

In [18]: def remove_background(image_roots):
    .....
